

Automation testing

Day-03 Assignment

1. Use if-else to find the greatest of three numbers.

The screenshot shows the Eclipse IDE interface. The Project Explorer on the left displays a project named 'CoreJavaBasic' with a source folder 'src' containing several Java files, including 'GreaterOfThreeNumber.java'. The main editor window shows the code for 'GreaterOfThreeNumber.java'. The code defines a package 'corejava', a class 'GreaterOfThreeNumber', and a 'main' method. Inside the 'main' method, three integers 'a', 'b', and 'c' are initialized with values 10, 30, and 60 respectively. An if-else statement is used to determine the greatest number: if 'a' is greater than or equal to both 'b' and 'c', it prints 'A'; else if 'b' is greater than or equal to both 'a' and 'c', it prints 'B'; else, it prints 'C'. The Console window at the bottom shows the output 'Greatest number is C'.

```
1 package corejava;
2
3 public class GreaterOfThreeNumber {
4
5     public static void main(String[] args) {
6         // TODO Auto-generated method stub
7         int a = 10;
8         int b = 30;
9         int c = 60;
10        if (a >= b && a >= c) {
11            System.out.println("Greatest number is A ");
12        }
13        else if (b >= a && b >= c) {
14            System.out.println("Greatest number is B ");
15        }
16        else {
17            System.out.println("Greatest number is C ");
18        }
19    }
20 }
21 }
22 }
```

Console Output: Greatest number is C

2. Implement a calculator using switch statement

The screenshot shows the Eclipse IDE with a Java project named 'CoreJavaBasic'. The 'src' folder contains a package 'corejava' with a file 'Calculator.java'. The code in 'Calculator.java' is as follows:

```
1 package corejava;
2 import java.util.Scanner;
3
4 public class Calculator {
5
6     public static void main(String[] args) {
7         // 1000 Auto-generated method stub
8         Scanner sc = new Scanner(System.in);
9
10        System.out.print("Enter first number: ");
11        double num1 = sc.nextDouble();
12
13        System.out.print("Enter second number: ");
14        double num2 = sc.nextDouble();
15
16        System.out.println("Choose an operation:");
17        System.out.println("1. Addition (+)");
18        System.out.println("2. Subtraction (-)");
19        System.out.println("3. Multiplication (*)");
20        System.out.println("4. Division (/)");
21
22        System.out.print("Enter your choice: ");
23        int choice = sc.nextInt();
24
25        switch (choice) {
26            case 1:
27                System.out.println("Result = " + (num1 + num2));
28                break;
29            case 2:
30                System.out.println("Result = " + (num1 - num2));
31                break;
32            case 3:
33                System.out.println("Result = " + (num1 * num2));
34                break;
35            case 4:
36                if (num2 != 0) {
37                    System.out.println("Result = " + (num1 / num2));
38                } else {
39                    System.out.println("Cannot divide by zero.");
40                }
41                break;
42            default:
43                System.out.println("Invalid choice.");
44        }
45        sc.close();
46    }
47 }
48
49
50
51
52
53
54
55
56
57
```

Output:

The screenshot shows the Eclipse IDE with the same 'Calculator.java' file. The 'Console' window at the bottom displays the output of the program:

```

-terminated: Calculator [Java Application] C:\Program Files\Java\jdk-22\bin\javaw.exe (10 Aug 2026, 9:20:49 pm - 9:21:10 pm elapsed 0:00:21) [pid: 75588]
Enter first number: 70
Enter second number: 70
Choose an operation:
1. Addition (+)
2. Subtraction (-)
3. Multiplication (*)
4. Division (/)
Enter your choice: 1
Result = 140.0

```
