

- 1) Write a program to handle Array related exception.
- 2) Write a program to store list of string values and
3. Write program to remove duplicate ^{display} integers from set and display.

①.

```

public class ArrayExceptionExample {
    public static void main (String [] args) {
        int [] numbers = {10, 20, 30, 40, 50};
        try {
            System.out.println ("Element : " + numbers [5]);
        }
        catch (ArrayIndexOutOfBoundsException e) {
            System.out.println ("Exception : Array index is out
                                of bound.");
        }
        System.out.println ("Program contin continues normally.");
    }
}

```

a/p:

Exception : Array index is out of bound.
Program continues normally.

②.

```

import java.util.ArrayList;

public class StringListExample {
    public static void main (String args[]) {
        ArrayList <String> names = new ArrayList <> ();
        names.add ("Apple");
        names.add ("Mango");
        names.add ("Oranges");
        names.add ("Banana");
        System.out.println ("List of string:");
        for (String name : names) {
            System.out.println (name);
        }
    }
}

```

Output:

List of string:

Apple
Mango
Oranges.
Banana.
